

Package ‘OpasnetUtils’

September 1, 2014

Type Package

Title Utility functions for dealing with data in Opasnet (www.opasnet.org) environment.

Version 1.1.0

Author Teemu Rintala, Einari Happonen, Jouni Tuomisto

Maintainer Teemu Rintala <teemu.rintala.a@gmail.com>

Description Contains tools for open assessments and modelling in the Opasnet environment.

The operating principle of this package is maximum openness and modularity. Variables are defined publicly on wiki pages using wiki inputs/tables, our database and R code. There are also a couple of impact assessment tools such as GIS functions in the package.

Imports methods, rjson, RCurl, reshape2, triangle, httpRequest, digest, xtable, ggplot2, rgdal, sp

License GPL-3

LazyLoad yes

URL <http://www.opasnet.org>, http://en.opasnet.org/w/Modelling_in_Opasnet, <http://en.opasnet.org/w/OpasnetUtils>

Check	<i>Ovariable Checks</i>
-------	-------------------------

Description

The Check functions are used to introduce common model specific alterations to variables without changing their definition directly.

Usage

```
CheckCollapse(variable, indent = 0, verbose = TRUE, ...)
CheckDecisions(variable, indent = 0, verbose = TRUE, ...)
CheckInput(variable, substitute = FALSE, indent = 0, verbose = TRUE, ...)
CheckMarginals(variable, deps = list(), priormarg = TRUE, indent = 0,
               verbose = TRUE, ...)
```

Arguments

variable	an ovariable to run Check on.
deps	the dependency list of a latent ovariable, used by CheckMarginals to keep track of index columns.
priormarg	flag determining whether columns are assumed to be indices by default when checking marginals.
substitute	flag determining whether model inputs should replace or append to current variable values.
indent	used by verbose to structure status messages by using indentation.
verbose	flag status message printing.
...	excess arguments are ignored.

Details

The Check functions are mainly used internally. They check for external instructions (model specific changes); specifically objects in `.GlobalEnv` with prefixes ("Col", "Dec", "Inp"). they are automated in the normal `ovariable` evaluation routine (`EvalOutput`).

`CheckCollapse` uses `CollapseMarginal` which collapses marginals by applying sums, means or samples. Also loses all non-marginal columns except the relevant "Result". It is mainly used to streamline models by reducing rows in data.

`CheckDecisions` checks for and applies decisions on variables. The function makes use of the `odecision-class`, which specifies the target cells as well as the effect. Odecisions are most often produced by `DecisionTableParser`.

`CheckInput` checks and uses outside input (run specific user inputs in models). Input should be in `ovariable` format.

`CheckMarginals` fills the marginal slot of an `ovariable` using information from variable data and upstream variable marginals. Assumes that all depended upon variables are loaded, as should be the case.

See also: <http://en.opasnet.org/>

Value

Original `ovariable` with possible adjustments.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
#library(OpasnetUtils)
#
Deca <- new(
  "odecision",
  decatable = data.frame(
    Decision = "Dec1",
    Option = c("do it", "BAU"),
    Cell = c("", ""),
    Change = c("Multiply", "Identity"),
    Result = c("2", "1")
  )
)
openv.setN(10)
a <- Ovariable("a", data = data.frame(A = c("A", "B"), Result = c("1-2", "2-4")))

b <- Ovariable("b", formula = function(...){2*a}, dependencies = data.frame(Name = "a"))

b <- EvalOutput(b)

b
oapply(a, a@output[c("A", "Dec1")], mean)
```

CollapseMarginal *Collapse marginals*

Description

Apply functions (only sample at the moment) over ovaribale indices

Usage

```
CollapseMarginal(variable, cols, fun = "mean", probs = NULL, ...)
```

Arguments

variable	an ovariable
cols	vector of column names or indices to collapse
fun	character name of function to be used to summarize
probs	list of vectors defining the distribution of values in a column index
...	excess arguments are ignored

Details

Samples over a fully defined column index (marginal) treating it as a nuisance parameter. Increases the joint distribution uncertainty (loses information). Weighted sampling is also possible.

Used to streamline heavy models (output has fewer rows of data).

See also: <http://en.opasnet.org/>

Value

Input ovariable with possibly lighter output.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
test <- Ovariable("test", output = data.frame(City = c("Helsinki", "Espoo"),
                                               Iter = 1, testResult = 1:2), marginal = c(TRUE, TRUE, FALSE))
CollapseMarginal(test, "City", "mean")
```

CollapseTableParser *Parsing Collapse orders from a table*

Description

Parses data.frames of specific format to produce "Col" prefixed lists for [CheckCollapse](#)

Usage

```
CollapseTableParser(CTable, env = .GlobalEnv)
```

Arguments

CTable	a data.frame with columns "Variable" (variable names), "Index" (column names) and "Probs" (probabilities of column levels in marginal distribution, comma separated)
env	target environment, default is .GlobalEnv

Details

Used in the Opasnet assessments/analyses to produce multiple model specific Collapse instructions. Using other distribution values than 1 requires knowledge about the amount and order of unique index values. Probs values 1 and NA are considered equal weighting.

See also: <http://en.opasnet.org/>

Value

No return value, "Col" prefixed variables are written straight into specified environment.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
a <- data.frame(Variable = "test", Index = c("City"), Probs = 1)
CollapseTableParser(a)
Coltest
```

ComputeDependencies *Evaluate ovariable dependencies*

Description

Fetches, evaluates and [Checks ovariable](#) dependencies given in data.frame format

Usage

```
ComputeDependencies(dependencies, forceEval = FALSE, indent = 0,
verbose = FALSE, new_code = FALSE, ...)
```

Arguments

dependencies	data.frame that defines <code>Fetch</code> targets, usually taken from an ovariable's dependencies slot
forceEval	if TRUE, forcibly re-evaluates existing instances of listed dependencies
indent	verbose print assist for the <code>Check</code> family, used internally
verbose	TRUE to enable status message printing assists (line breaks) and status messages for other function calls
new_code	a flag for compatibility with older code, default FALSE nullifies <code>ComputeDependencies</code> usage in ovariable formulas
...	arguments to pass on to the various recursive checks and evaluations

Details

`ComputeDependencies` uses `Fetch`, `EvalOutput`, `CheckDecisions`, `CheckCollapse` and `CheckInput` to load and pre-process upstream variables. It is automatically called by `EvalOutput`, but can be seen on the first lines of old ovariable formula code, to avoid applying decisions, inputs and optimizations twice in old code the function does nothing by default. This is no problem since users should not be calling this function at all. `ComputeDependencies` also does most of the exception handling in the recursive ovariable model.

See also: <http://en.opasnet.org/>

Value

No return value

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

continuousOps

Simple continuous index merge and Ops

Description

`continuousOps` merges two ovariables by continuous indices and performs an operation.

Usage

```
continuousOps(01, 02, fun, cols = NULL)
```

Arguments

01	ovariable
02	ovariable
fun	function or function name (character) that is to be performed. Typically '*', '+' or some other Ops.
cols	character vector of column names that contain continuous indices. Only needed if there are > 1 indices and the order is critical. Otherwise, shared continuous indices are identified automatically.

Details

O1 is of main interest, while O2 has information that links to O2 via continuous index or indices. All locations in these continuous indices of O1 are created for O2 assuming that the value in the previous location of cols applies. Note that this is asymmetric. Locations in O2 that are missing from O1 are omitted. continuousOps assumes that all continuous indices are in the same dimension, the first one being the main index. Additional indices affect the outcome only if there are (approximate) ties. Therefore, avoid using this with several continuous indices. However, if continuous indices are NOT shared by both O1 and O2, they cause no trouble.

See also: <http://en.opasnet.org/>

Value

Returns an Ovariable

Author(s)

J. Tuomisto <jouni.tuomisto@thl.fi>

convert.units

Converting units

Description

Converts units (to SI equivalents by default)

Usage

```
convert.units(x, tounit = c("kg", "s", "m", "m3", "J", "W", "A",
    "V", "C", "N", "Pa", "Hz", "mol"), fromunit = NULL)
```

Arguments

x	numeric vector with values to be converted
tounit	character vector of the new units to be used
fromunit	character vector or factor with the current units

Details

Uses the table in en.opasnet.org/w/Unit_conversions for the conversions, so the units used have to be specified there.

See also: <http://en.opasnet.org/>

Value

Returns a data.frame

Author(s)

J. Tuomisto <jouni.tuomisto@thl.fi>

Examples

```
convert.units(1, tounit = c("pg", "l"), fromunit = "ug /m3")
```

ddata_apply

Dynamic data link activation

Description

Fetches the latest data associated with an **ovariable** from the OpasnetBase if available

Usage

```
ddata_apply(ovariable, ddata_tidy = TRUE, force_ddata = FALSE, ...)
```

Arguments

ovariable	an ovariable with the ddata slot defined as page_id i.e. "Op_en1000"
ddata_tidy	TRUE to run tidy on downloaded data
force_ddata	if TRUE, dynamic data links are used even if the data slot of an ovariable is already defined
...	excess parameters are ignored

Details

This function is mostly used internally

See also: <http://en.opasnet.org/>

Value

Returns the input ovariable. (Re)defines the data slot if it is not already defined ands ddata is available.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

See Also

[ovariable](#)

DecisionTableParser *Parse data.frame for decisions*

Description

Parses a `data.frame` into `odecisions`.

Usage

```
DecisionTableParser(DTable, env = .GlobalEnv)
```

Arguments

DTable	<code>data.frame</code>
env	target environment, default is <code>.GlobalEnv</code>

Details

Decisions consist of conditions and effects, target a certain variable and may have multiple options.

Input format is described on <http://en.opasnet.org/w/Decision>. Currently usable decision effects are Add, Multiply, Replace, Remove and Identity.

See also: <http://en.opasnet.org/>

Value

No return value. Saves `odecision` class objects into specified environment.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

See Also

[CheckDecisions](#)

Examples

```
modeldecisions <- data.frame(Stakeholder = "Group A", Decision = "More wind power",
  Option = "A few more turbines", Variable = "PowerGeneration", Cell = "Type:Wind",
  Change = "Add", Result = "5")
DecisionTableParser(modeldecisions)
ls()
```

dropall*Dropall*

Description

Drops unused factor levels in data.frames

Usage

```
dropall(x)
```

Arguments

x	a data.frame
---	--------------

Details

This function makes sure that the factor levels in a data.frame do not contain entries that have already been removed from the factor itself.

See also: <http://en.opasnet.org/>

Value

data.frame

Author(s)

J. Tuomisto <jouni.tuomisto@thl.fi>

Examples

```
a <- data.frame(A = c("a", "b"), B = c(1,1))
levels(a[[1]])

a <- a[-2 ,]
levels(a[[1]])
a[[1]]

a <- dropall(a)
levels(a[[1]])
a[[1]]
```

EvalOutput	<i>Evaluate ovariable output</i>
------------	----------------------------------

Description

Evaluate the output slot of an **ovariable**, which usually means recursively evaluating any dependent variables as well.

Usage

```
EvalOutput(variable, fillna = FALSE, indent = 0, verbose = FALSE, ...)
```

Arguments

variable	an ovariable
fillna	if TRUE, fillna is attempted at the end
indent	internal integer argument used in verbose printing
verbose	use TRUE to enable status messages while processing outputs and various checks
...	arguments are passed on to ovariable formulas and to dependent EvalOutput calls (recursivity), number of iterations (N) is commonly set here

Details

EvalOutput automates most of the other features related to ovariable handling. It runs **ComputeDependencies** first, produces a **data.frame** by combining the return values from **interpreting** the data slot and running the formula slot function, makes a "Source" -column to distinguish between the two "Results" and lastly **CheckMarginals** is run on the variable (optionally also **fillna**).

Since EvalOutput is usually run on the end node of a model, there should not be inputs or decisions hence they are not checked for. In contrast ComputeDependencies runs all Checks besides CheckMarginals.

See also: <http://en.opasnet.org/>

Value

Returns the input ovariable with the output slot (re)defined.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
a <- Ovariable("a", data.frame(A = c("a", "b"), Result = c("1-2", "1-4")))
a <- EvalOutput(a, N = 10)
a@output
```

Fetch*Fetch R objects described in a data.frame***Description**

Download a batch of R objects from Opasnet servers.

Usage

```
Fetch(dependencies, evaluate = FALSE, indent = 0, verbose = TRUE, ...)
Fetch2(...)
```

Arguments

dependencies	data.frame which defines variable names and "locations"
evaluate	TRUE to run EvalOutput on each variable (non-variables are ignored)
indent	integer internal argument for verbose printing
verbose	use TRUE to enable status messages in between fetches
...	excess arguments are ignored or passed to EvalOutput if evaluate is TRUE

Details

The input data.frame should have columns "Name" and at least one of "Key" and "Ident".

Key is the R-tools session identifier (shown at the end of the url). Ident should be in format <page_id>/<code_name>.

Fetch first checks if the variable (or something with the same name) is already available, if it is nothing will be done. If Key is defined (not NA or "") for a variable it takes precedence over Ident.

Fetch is run as first part of [ComputeDependencies](#).

See also: <http://en.opasnet.org/>

Value

No return value. Fetched variables are written in .GlobalEnv.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
deps <- data.frame(Name = "exposure", Key = "6WYTFxiZUIxiY8tw")
#Fetch(deps)
#exposure

# If variable exists
exposure <- 1
Fetch(deps)
exposure # by default nothing is changed
```

fillna	<i>Interpreting empty locations in indices</i>
--------	--

Description

Copies result rows that have NAs as index values and replaces the index value with all available values of that index.

Usage

```
fillna(object, marginals)
```

Arguments

object	a <code>data.frame</code> to be filled
marginals	integer, positions of columns whose locations contain NAs that should be duplicated

Details

Runs `dropall` before duplication to avoid unnecessary levels.

See also: <http://en.opasnet.org/>

Value

Returns a `data.frame`

Author(s)

J. Tuomisto <jouni.tuomisto@thl.fi>

Examples

```
a <- data.frame(A = c("a", "b", NA), B = c(1, 2, 3))
fillna(a, 1)
```

GIS	<i>Opasnet spatially distributed data interfaces</i>
-----	--

Description

Currently there are only two GIS functions: one for producing spatial concentration maps (`GIS.Concentration.matrix`) and one for using spatial population data and concentration maps to calculate exposure (`GIS.Exposure`).

Usage

```
GIS.Concentration.matrix(Emission, L0, LA, distx = 10.5, disty = 10.5,
                         resolution = 1, N = 1000, dbug = FALSE, ...)
GIS.Exposure(Concentration.matrix, dbug = FALSE, ...)
```

Arguments

Emission	numeric, emission in any units; can be an ovariable as well
Concentration.matrix	ovariable concentration matrix, usually produced by GIS.Concentration.matrix
LO	numeric, longitude corresponding to the center of the considered area (emission source)
LA	numeric, latitude corresponding to the center of the considered area (emission source)
distx	numeric, maximum distance from center on the x axis of the area, 10.5 corresponds to the source-receiver-matrices used
disty	numeric, maximum distance from center on the y axis of the area, 10.5 corresponds to the source-receiver-matrices used
resolution	numeric, size of the grid, default 1 is 1km x 1km grid
N	integer, number of iterations to run
dbug	use TRUE to turn debug prints on
...	excess arguments are ignored or passed to tidy on data download

Details

The concentration matrix is computed using PILTTI source-receiver-matrices (http://en.opasnet.org/w/Piltti_source-receptor_matrix). They are originally for modeling PM2.5 distributions in a few Finnish cities between the years 2000 and 2003. To produce a rudimentary probability distribution these matrices are randomized between iterations.

Exposure is calculated by matching a concentration matrix to Finnish population data (http://en.opasnet.org/w/Special:Opasnet_Base?id=op_en2949.2012).

LA and LO are not required arguments for exposure, but speed the computation significantly.

See also: <http://en.opasnet.org/>

Value

GIS.Concentration.matrix returns an ovariable whose output is a grid defined as bins for coordinates.

GIS.Exposure returns an ovariable whose output is concentration * population. All population data that matches cells defined by the concentration matrix is included in the output.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
# Excerpt from http://en.opasnet.org/w/Health_impacts_of_fine_particles_in_Rauma
# (not evaluated)

# Paasto Emissions

Paasto <- new(
  "ovariable",
  name = "Paasto",
  dependencies = data.frame(Name = "tieliikenepaastot", Key = "0194s0uuucjxq8Wi"),
```

```

formula = function(dependencies, ...) {
  ComputeDependencies(dependencies, ...)

  # Muutetaan paivapaasto vuosipaastoksi ja grammat tonneiksi
  out <- tieliikenepaastot * 365 * 1E-6

  return(out)
}

# Muita tarpeellisia arvoja Other important values

bg.mort <- 45182 / 5203826 # same values as used in PILTTI

## J. T. Tuomisto, A. Wilson, et al. Uncertainty in mortality response to
## airborne fine particulate matter... 2008
erf <- 0.0097
# unit: m^3 /ug

# Ovariablit

## Pitoisuudet Concentrations

Pitoisuus <- new(
  "ovariabile",
  name = "Pitoisuus",
  dependencies = data.frame(
    Name = c("Paasto", "L0", "LA")
  ),
  formula = function(dependencies, ...) {
    ComputeDependencies(dependencies, ...)
  }

  temp <- GIS.Concentration.matrix(Paasto, L0, LA, ...)

  return(temp)
}
)

## Altistuminen Exposure

Altistuminen <- new(
  "ovariabile",
  name = "Altistuminen",
  dependencies = data.frame(
    Name = c("Pitoisuus", "L0", "LA")
  ),
  formula = function(dependencies, ...) {
    ComputeDependencies(dependencies, ...)
  }

  out <- GIS.Exposure(Pitoisuus, L0, LA, ...)

  return(out)
}
)

```

interpret*Parse human readable distribution definitions***Description**

Interpret textual data into probability distributions using regular expressions.

Usage

```
interpret(idata, N = NULL, rescol = "Result", dbug = FALSE, ...)
```

Arguments

idata	input, character or data.frame
N	number of iterations
rescol	name of result column, defaults to "Result"
dbug	use TRUE to turn on debug prints
...	excess arguments are ignored

Details

Interpretation rules are as follows: Empty space is stripped away. "X-Y" defines a uniform distribution between X and Y, if Y/X is greater than 100 then logarithmic uniform distribution is assumed. Negative X and Y are determined by the number of "-": if 2, X is negative; if 3, both are.

"<X" defines a uniform distribution between 0 and X.

"X+-Y" defines a normal distribution with mean X and sd Y.

"X(Y-Z)" defines a normal distribution where Y-Z is assumed the 95-percent confidence interval, from which sd is determined.

If distance from mean to the higher boundary is 50-percent higher than to lower boundary log normality is assumed.

"X:Y:Z" defines a triangular distribution with min, mode and max (can be given in any order).

"X1:X2;...;Xn" defines a random unbiased sample (with replacement) between the given elements. Numeric values are left as is.

See <http://en.opasnet.org/w/Interpret> for a table.

See also: <http://en.opasnet.org/>

Value

Returns a data.frame with an "Iter" column added. Uninterpretable values are converted to NAs.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
interpret(c("1-4", "1-1000"), N = 5)
```

oapply	<i>Apply for ovariables</i>
--------	-----------------------------

Description

Use tapply on the output slot

Usage

```
oapply(X, INDEX = NULL, FUN = NULL, cols = NULL, ..., simplify = TRUE)
```

Arguments

X	an ovariable
INDEX	list of factors, like tapply
FUN	function to apply
cols	names of columns to be removed (reverse INDEX)
...	optional arguments to FUN
simplify	like tapply

Details

See also: <http://en.opasnet.org/>

Value

Returns an ovariable, with output slot tapplyed and marginal adjusted accordingly.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
a <- new("ovariable", name = "a", output = data.frame(A = c("a", "a", "b", "b"),
  B = c("1", "2", "1", "2"), aResult = 1:4), marginal = c(TRUE, TRUE, FALSE))
oapply(a, FUN = sum, cols = "A")
oapply(a, a@output[c("A")], sum)
```

objects

Server side shared R objects

Description

Library for using R objects (like `ovariables`.) stored in Opasnet R server. Also includes basic encryption and decryption functionality for R objects.

Usage

```
objects.encode(obj, key)
objects.decode(eobj, key)
objects.get(token)
objects.latest(page_ident, code_name, verbose = FALSE)
objects.put(..., list = character())
objects.store(..., list = character(), verbose = FALSE)
```

Arguments

<code>obj</code>	Any R object.
<code>eobj</code>	An encoded object returned by <code>objects.encode</code> function.
<code>key</code>	Key string to encode or decode objects. Must be 16,32 or 64 characters in length.
<code>token</code>	R-tools run token string to identify a stored object on Opasnet R server.
<code>page_ident</code>	Opasnet Media Wiki page identifier (e.g. op_en1390).
<code>code_name</code>	Name of the R code block in Opasnet Media Wiki (the name argument in <code>rcode</code> tag).
<code>verbose</code>	Flag to set more verbose output (for debug purposes).
<code>...</code>	Objects will be passed straight to R core save function.
<code>list</code>	List will be passed straight to R core save function.

Details

The main purpose of this library is to provide means to store R objects to Opasnet R server for later use. This is specifically useful and embraced in Opasnet R ecosystem where this library is mainly used for storing and fetching `ovariables`. Storing objects is currently only possible within Opasnet Media Wiki environments (using R code inside `rcode` tags), but reading objects stored by running code within public wikis is also possible from local R-installation.

Besides object storing, this library provides basic functionality to encode and decode R objects. This is done by using R base serialization functions and `digest` library. Objects given to `objects.encode` will be encoded by using AES function in "ECB" mode. Longer key (16, 32 or 64 characters) obviously means more secured encryption too. Same key must be used for both encryption and decryption.

See also: <http://en.opasnet.org/>

Value

objects.encode Returns encoded object to be decoded with objects.decode and given key.
objects.decode Returns decoded object, as it was before encoding with objects.encode.
objects.get Returns object or objects stored to Opasnet R server.
objects.latest Returns object or objects stored to Opasnet R server.
objects.put No return value.
objects.store Returns token to identify stored objects on R server.

Author(s)

E. Happonen <einari.happonen@thl.fi>

See Also

[load](#)
[save](#)
[serialize](#)
[AES](#)

Examples

```
library(OpasnetUtils)

# Within Opasnet only! Let's assume that the (en.opasnet.org) page identifier -
# where to code is - would be "Op_en1390" and code name "objs_save_test".
# x <- stats::runif(20)
# y <- list(a = 1, b = TRUE, c = "Jeah baby jeah!")
# objects.store(x, y)

# Fetching can be done also from local R installation.
objects.latest("Op_en1390","objs_save_test")
print(x)
print(y)

# Object encrypt and decrypt

key <- "1234567890abcdef"

eobj <- objects.encode(y, key)
print(eobj)
obj <- objects.decode(eobj, key)
print(obj)
```

Description

Check shared indices, dropped locations and some statistical metrics

Usage

```
odebug(x, variance = FALSE)
```

Arguments

x	ovariable to be debugged
variance	If TRUE runs variance analysis between indices of the given ovariable.

Details

Checks output lengths, number of NAs, common and matching marginals, missing locations in common marginals and performs variance analysis if required. Variance analysis is only performed up to second order, the intended use is to quantify overlap between indices.

Value

List of outputs.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
test <- data.frame(
  A = c("x", "y", "z"),
  B = rep(c("a", "b", "c"), each = 3),
  C = rep(c("1", "2", "3"), each = 3*3),
  testResult = runif(1*3*3*3)
)
test <- Ovariable(
  name = "test",
  output = test,
  marginal = c(TRUE, TRUE, TRUE, FALSE)
)
odebug(test, variance = TRUE)
```

odecision-class *Class "odecision"*

Description

Definition container for [CheckDecisions](#)

Details

Usually odecisions are created by [DecisionTableParser](#) using a full decision table that includes condition and effect descriptions in standard form. Odecisions created by DecisionTableParser do not have condition or effect defined. Instead [CheckDecisions](#) does the final parsing into preset effects and conditions. For non-standard conditions and effects decisions can be defined using the new("odecision", ...) call.

See also: <http://en.opasnet.org/>

Objects from the Class

Objects can be created by calls of the form `new("odecision", ...)`.

Slots

deactable: Object of class "data.frame" describes the decisions and their relevant options. It is merged with the output slot `data.frame` of an `ovariable`

condition: Object of class "list" contains functions which return a logical vector that should indicate the relevant rows to be affected by a decision-option combination.

effect: Object of class "list" contains functions which describe the effects of the decision on relevant rows of the output.

Methods

No methods defined with class "odecision" in the signature.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

odist

Random sampling using ovariables as parameters

Description

Currently there are only GIS functions for producing spatial concentration maps (`GIS.Concentration.matrix`) and using (closed) spatial population data to calculate exposure (`GIS.Exposure`).

Usage

`odirichlet(a, n = 0, ...)`

Arguments

- a ovariable containing distribution parameters
- n numeric, number of samples. If 0, `openv$N` is used instead.
- ... arguments passed to `oapply`

Details

Odirichlet is based on functions `ddirichlet` and `rdirichlet` from gtools `dirichlet.R` (originally contributed by Ian Wilson). The "Dirichlet function" is the multidimensional generalization of the beta distribution: it's the Bayesian canonical distribution for the parameter estimates of a multinomial distribution. Odirichlet samples from the dirichlet distribution given parameter vectors that are processed by `oapply`.

Value

ovariable

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
openv$N <- 5

test <- Ovariable(
  output=data.frame(
    a = 1:4,
    b = rep(letters[1:4], each = 4),
    c = rep(toupper(letters[1:4]), each = 4^2),
    Result = 1:(4^3)),
  marginal=c(rep(TRUE, 3), FALSE))
out <- odirichlet(test, cols = "a")
oapply(out, FUN = sum, cols = "a")

test <- Ovariable(
  output=data.frame(
    a = 1:4,
    b = rep(letters[1:4], each = 4),
    Iter = rep(toupper(letters[1:4]), each = 4^2),
    Result = 1:(4^3)),
  marginal=c(rep(TRUE, 3),FALSE))
out <- odirichlet(test, cols = "a")
oapply(out, FUN = sum, cols = "a")
```

opasnet

Importing files from Opasnet

Description

Functions for downloading files from Opasnet Media Wiki environments.

Usage

```
opasnet.data(filename, wiki = "", unzip = "")
opasnet.csv(filename, wiki = "", unzip = "", ...)
opasnet.page(pagename, wiki = "")
```

Arguments

filename	Path to file in Opasnet after the "images/" part.
pagename	Name of a page in Opasnet.
wiki	Name of the Opasnet wiki: "opasnet_en" for en.opasnet.org, "opasnet_fi" for fi.opasnet.org or "heande" for heande.opasnet.org (accessible only within Heande wiki).
unzip	Name of the file in the package (if compressed using zip).
...	Excess arguments will be passed to <code>read.table</code> function when downloading csv-file.

Details

These functions make it easy to download Opasnet files for being used in R. Required path (file-name) for file must be resolved using the corresponding Media Wiki. Big data files should always be compressed before uploading to Opasnet. Using the unzip-argument makes it easy to download and directly use any zip-compressed files. `opasnet.page` downloads wiki pages using `getURL` from `RCurl`.

See also: <http://en.opasnet.org/>

Value

<code>opasnet.data</code>	Returns the file data as is.
<code>opasnet.csv</code>	Returns <code>data.frame</code> parsed from csv file.
<code>opasent.page</code>	Returns the web page as a single string.

Author(s)

E. Happonen <einari.happonen@thl.fi>, T. Rintala <teemu.rintala.a@gmail.com>

See Also

[read.table](#)

Examples

```
opasnet.csv("4/49/Test.zip", wiki = "opasnet_fi", unzip = 'ejpop.csv', sep=';')
opasnet.data("c/cc/Test_bugs_model.txt", wiki = "opasnet_en")
```

opbase

OpasnetBase Access

Description

Function family for interacting with the Opasnet database.

Usage

```
opbase.data(ident, series_id = NULL, subset = NULL, verbose = FALSE,
            username = NULL, password = NULL, samples = NULL, exclude = NULL,
            include = NULL, range = NULL, optim_test = TRUE, ...)
opbase.locations(ident, index_name, series_id = NULL, username = NULL,
                  password = NULL)
opbase.obj.exists(ident, username = NULL, password = NULL)
opbase.series(ident, username = NULL, password = NULL, verbose = FALSE)
opbase.indices(ident, act = NULL, username = NULL, password = NULL, verbose = FALSE)
opbase.upload(input, ident = NULL, name = NULL, subset = NULL,
              obj_type = "variable", act_type = "replace", language = "eng",
              unit = "", who = NULL, rescol = NULL, chunk_size = NULL, verbose = FALSE,
              username = NULL, password = NULL, index_units = NULL, index_types = NULL)
```

Arguments

ident	Object ident as string (e.g. "op_en1390"). Optional when uploading within Opasnet; page ident will be taken from the page where the code is.
series_id	Series identifier as integer.
act	Act identifier as integer.
index_name	Column name (index) whose locations should be returned.
subset	Subset data name. Objects can have subsets of data, identified by subset names.
verbose	Flag to view detailed debug output.
username	Opasnet Base username.
password	Opasnet Base password.
samples	Limit the number of samples in result. Default is to get them all.
exclude	Filter result by excluding rows that contain locations defined here as list. Works only with entity type indices!
include	Filter result by only including rows that contain locations defined here as list. Works only with entity type indices!
range	Filter result by setting ranges for index location values. Works only with number and time type indices!
optim_test	Generally faster download, slower only when downloading large probability distributions from the database.
input	Input data as <code>data.frame</code> .
name	Object name for upload.
obj_type	Object type string: 'variable', 'study', 'method', 'assessment', 'class', 'nugget' or 'encyclopedia'.
act_type	Act type string: 'replace' or 'append'. Replace type uploads data to new series. Append adds new act to latest series.
language	Data language identifier string in ISO 639.2 standard.
unit	String identifying the result unit(s).
who	Name or alias of the data uploading person.
rescol	Name of the result column index.
chunk_size	Size of upload data chunk in rows.
index_units	Units for indices in vector as strings. E.g. <code>c('cm2', 'm2', 'ug/m3')</code> .
index_types	Types for indices in vector as strings. Possible types are: 'entity' for limited set of locations, 'number' for real numbers and 'time' for date time strings. E.g. <code>c('entity', 'entity', 'number')</code> .
...	Excess arguments are ignored.

Details

This family of functions provide access to Opasnet Base -database. Opasnet Base is the database used for storing Opasnet data. Use the `opbase.data` function to read data from the database and the `opbase.upload` function to upload data to the database. Note that uploading data from local R-installation requires Opasnet Base username and password. These can be obtained only by trusted people.

Exclude and include syntax: `list = ('<index name 1>' = c('<location value 1>', '<location value 2>', ...), '<index name 2>' = c('<location value 1>', '<location value 2>', ...), ...)`

Range syntax: list = ('<index name 1>' = c(<range from>|NA, <range to>|NA),
'<index name 2>' = c(<range from>|NA, <range to>|NA), ...)

See also: http://www.loc.gov/standards/iso639-2/php/code_list.php
<http://en.opasnet.org/>

Value

opbase.data Returns data.frame containing the query result data.
 opbase.locations Returns list of locations and their ids (as keys).
 opbase.obj.exists Returns TRUE if object exists, FALSE if not.
 opbase.series Returns vector of series ids.
 opbase.indices Returns a character vector of data indices.
 opbase.upload Returns total number of data rows uploaded.

Author(s)

E. Haponen <einari.haponen@thl.fi>

Examples

```
library(OpasnetUtils)

# Read
opbase.data('op_en1390')
opbase.data('op_en2949', subset='2012', include = list('KUNTA' = 322),
            range = list('ID_NRO' = c(20000, 30000), 'XCOORD' = c(NA,244000)))

# Write (works only within Opasnet when username nor password is given)
input <- matrix(c('male', 12334435.123, 22, 'female', 234345.23423, 33),
                ncol=3, byrow=TRUE)
colnames(input) <- c("Sex","Some number","result")
input <- as.data.frame(input)
#res <- opbase.upload(input, ident="op_en1390", name = "Sandbox TEST",
#                      index_types = c('entity','number'), unit = "Age", who='Tester person')
```

Description

Container for model-wide parameters such as number of iterations used in random sampling.

Usage

openv.setN(x)

Arguments

x numeric, new default number of iterations

Details

The environment is also automatically populated by `CheckDecisions` to communicate evaluation to other branches of the recursion tree. The value N in this environment is used by `interpret` when N is not given in an `EvalOutput(...)` call.

Value

No return value.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
openv$N
openv.setN(1)
openv$N
openv$N <- 2
openv$N
```

oprint

Print ovariables or data frames in html format.

Description

`Oprint` uses `xtable` to output `ovariables` or `data.frames` or `matrix` as html formatted tables. In other cases uses regular print but adds formatting.

Usage

```
oprint(x, pre = TRUE, ...)
oprint.table(x, show_all = FALSE, sortable = TRUE, ...)
```

Arguments

<code>x</code>	Any object with a print or <code>oprint</code> method.
<code>pre</code>	TRUE for <code><pre></pre></code> formatting.
<code>show_all</code>	if TRUE all data rows are printed, else only first thousand rows get printed (default).
<code>sortable</code>	if TRUE output table is made sortable.
...	extra arguments are passed to <code>oprint.table</code> and/or <code>xtable</code>

Details

If argument `x` is an `ovariable`, its output-slot gets printed. If output-slot is empty, `EvalOutput` will be automatically executed to generate output. This function is aimed for being used within Opasnet only! R console will print out html markup. `oprint.table` is not exported. Use `oprint` instead and ... to pass arguments `show_all` and `sortable`.

See also: <http://en.opasnet.org/>

Value

Input data as html formatted table string.

Author(s)

E. Haponen <einari.haponen@thl.fi>

See Also

[xtable](#)

Examples

```
library(OpasnetUtils)
x <- data.frame(c(1,2),c(2,4))
oprint(x)
```

Optimize

Simple optimization between discrete index locations

Description

Finds the minimal value of an ovariable along given indices. Returns sought rows and drops the rest.

Usage

```
Optimize(...)
Minimize(data, indices)
```

Arguments

...	arguments passed to Minimize
data	ovariable or data.frame of suitable format (must contain a "Result" column)
indices	character vector of index names meant to be retained (tapply INDEX)

Details

Uses [tapply](#) and [which.min](#).

Value

Returns a data.frame which is a subset of the original data.frame or ovariable@output.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
a <- Ovariable(output = data.frame(A = letters[c(1,1,2,2)], B = c(1,2,1,2), Result = 1:4))
Minimize(a, "B")
Minimize(a, "A")
```

op_base*Functions for Interaction with the Opasnet Base (obsolete)*

Description

A collection of functions used in Opasnet for database interaction. Includes functions for fetching datasets, exploring the dimensions of Opasnet variables and writing objects into the database.

This function family has been replaced by the [opbase](#) family

Usage

```
op_baseGetData(dsn, ident, ...)
op_baseGetLocs(dsn, ident, ...)
```

Arguments

dsn	a defined Data Service Name (in ODBC) to use
ident	object identifier in Opasnet (or other)
...	arguments for opbase

Details

Obsolete.

See also: http://en.opasnet.org/w/Opasnet_Base_Connection_for_R

Value

`op_baseGetData` Returns data as a data.frame.
`op_baseGetLocs` Returns dimension information as a data.frame.
`op_baseWrite` Returns 0 if successful.

Author(s)

Teemu Rintala, <teemu.rintala@thl.fi>

Examples

```
## Not run: op_baseGetLocs("opasnet_base", "Op_en4723")
## Not run: asthma <- op_baseGetData("opasnet_base", "Op_en4723", exclude = 48823)
```

orbind	<i>Rowbinding ovariables</i>
--------	------------------------------

Description

Combine two ovariables or data.frames using rbind even if columns differ

Usage

```
orbind(x, y)
```

Arguments

x	first object
y	second object

Details

Missing columns from each **ovariable** are added to the other and filled with NA.

See also: <http://en.opasnet.org/>

Value

Returns a data.frame

Author(s)

J. Tuomisto <jouni.tuomisto@thl.fi>

Ovariable	<i>Ovariable constructor</i>
-----------	------------------------------

Description

Create **ovariables** more conveniently

Usage

```
Ovariable(name = character(), data = data.frame(),
           formula = function(...) {0}, dependencies = data.frame(),
           ddata = character(), output = data.frame(), marginal = logical(),
           subset = character(), getddata = TRUE, save = FALSE, public = TRUE, ...)
```

Arguments

<code>name</code>	character string for the name slot, should match object name
<code>data</code>	<code>data.frame</code> for the data slot
<code>formula</code>	function for the formula slot
<code>dependencies</code>	<code>data.frame</code> for the dependencies slot
<code>ddata</code>	character string specifying an Opasnet page identifier (Op_enXXXX) for the ddata slot
<code>output</code>	<code>data.frame</code> for the output slot
<code>marginal</code>	logical for the marginal slot
<code>subset</code>	character string specifying an Opasnet Base subset (See opbase.data for details)
<code>getddata</code>	if TRUE dynamic data link will be activated immediately, which means that by default data will not be refreshed at model runtime
<code>save</code>	if TRUE resulting ovariable will be saved on the server
<code>public</code>	if TRUE <code>objects.store</code> is used instead of <code>objects.put</code> (the former stores the run key in a public database)
<code>...</code>	more arguments can be passed onto <code>objects.store</code> and <code>objects.put</code> in case <code>save == TRUE</code> .

Details

Just a regular constructor with integrated dynamic data link activation and storing options.

See also: <http://en.opasnet.org/>

Value

Returns an ovariable.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

See Also

[ovariable-class](#)

Examples

```
## Not run: Ovariable("A", ddata = "Op_en5674", getddata = TRUE)
## Not run: k <- Ovariable("k", output = data.frame(B = "a", Result = 1))
```

ovariable-class	<i>Class "ovariable"</i>
-----------------	--------------------------

Description

Standard modelling variables for the Opasnet modelling framework

Objects from the Class

Objects can be created by calls of the form `new("ovariable", ...)`. Or by using the [Ovariable](#)-constructor.

Slots

- name:** Object of class "character" name of variable, should match object name
- output:** Object of class "data.frame" output from formula and/or data operations
- data:** Object of class "data.frame" data describing the variable, should have a "Result" column
- marginal:** Object of class "logical" identifies output columns which are considered indices
- formula:** Object of class "function" a function that produces a data.frame that describes this variable
- dependencies:** Object of class "data.frame" list of variables that are used in formula, format is described in details for [Fetch](#)
- ddata:** Object of class "character" specifies an Opasnet page identifier (Op_enXXXX) which will be used to download most recent data on this variable in the Opasnet database

Methods

- Math** signature(`x = "ovariable"`): [Math](#) will be applied on Result column of output
- merge** signature(`x = "data.frame", y = "ovariable"`): data.frame will be converted to ovariable (with only output slot defined) and then merged
- merge** signature(`x = "numeric", y = "ovariable"`): numeric is converted to data.frame and then to ovariable and then merged
- merge** signature(`x = "ovariable", y = "data.frame"`): same as above
- merge** signature(`x = "ovariable", y = "numeric"`): same as above
- merge** signature(`x = "ovariable", y = "ovariable"`): output slots will be merged with all = TRUE, a blank ovariable with only output defined is returned
- Ops** signature(`e1 = "numeric", e2 = "ovariable"`): numeric is converted to data.frame and then to ovariable and then operated
- Ops** signature(`e1 = "ovariable", e2 = "numeric"`): same as above
- Ops** signature(`e1 = "ovariable", e2 = "ovariable"`): the ovariables are merged and then the two Result columns are operated unto, the result is saved in another Result column (or the same if they are not named: "Var1Result" vs "Result")
- plot** signature(`x = "ovariable"`): plots a simple comparison between sources (data vs formula)
- summary** signature(`object = "ovariable"`): returns a data.frame. Takes `function_names` and `marginals` as extra arguments. The former matches character vector elements into functions which will be tapplyed with. The latter matches character vector elements to output data.frame columns which define INDEX. The default is to tapply over iterations using `mean`, `sd`, `min`, `quantile(probs=0.025)`, `median`, `quantile(probs=0.975)` and `max`.

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

See Also

[Ovariable](#)

result

Access result vector of an ovariable

Description

A shortcut to the Result column of the `data.frame` in the output slot of an `Ovariable`.

Usage

```
result(e1)
```

Arguments

`e1` an [Ovariable](#)

Details

See also: <http://en.opasnet.org/>

Value

Returns a numeric vector

Author(s)

J. Tuomisto <jouni.tuomisto@thl.fi>

Examples

```
a <- Ovariable("a", output = data.frame(Result = 1))
result(a)
result(a) <- 10 * result(a)
a$output
```

tidy	<i>Format database output for use in ovariables</i>
------	---

Description

Wrapper for various standard operations applied on ovariable data from the OpasnetBase.

Usage

```
tidy(data, objname = "", idvar = "Obs", direction = "wide",
      widecol = NULL, base1 = FALSE)
```

Arguments

data	<code>data.frame</code> to be formatted
objname	character prefix to be added to variable specific rows like "Result" and "Unit"
idvar	reshape idvar
direction	reshape direction
widecol	reshape timevar, specifiec column to be expanded
base1	compatibility with obsolete database

Details

Uses reshape, renames "Result" and "Unit" columns and gets rid of unwanted columns from old database merged data.

See also: <http://en.opasnet.org/>

Value

Returns a `data.frame`

Author(s)

T. Rintala <teemu.rintala.a@gmail.com>

Examples

```
var1 <- opbase.data("Op_en5674")
var1 <- tidy(var1, "var1")
var1
```

unkeep	<i>Remove unnecessary columns</i>
--------	-----------------------------------

Description

Removes columns in ovariable outputs

Usage

```
unkeep(X, cols = NA, sources = FALSE, prevresults = FALSE)
```

Arguments

X	an ovariable to be worked on
cols	character vector of columns to be removed
sources	if TRUE removes "...Source"-columns
prevresults	if TRUE removes Result-columns of other variables

Value

ovariable
